

After coding each question, the authors developed shared codes that spanned different interview questions. This method yielded 28 codes. The codes and their corresponding quotes from participants are also available at bit.ly/3Xj2rSz.

1. Interesting/enjoyable to see the dashboard and its changes
2. Surprising to see the user model
3. User models provide transparency/explainability
4. Interesting/enjoyable to use controls
5. Controls provide obvious/predictable changes
6. Controls also lead to subtle changes
7. Controls are useful for error-fixing and personalization
8. Controls are useful for “getting out of the box” => walking in someone’s shoes
9. Control button is convenient
10. Useful for transparency/explainability/controllability/personalization
11. Dashboard build user’s trust in chatbot
12. Current attributes are not concerning for privacy because they are general/broad
13. Some attributes (that are not included in the current dashboard) might be concerning
14. Increase Trust: Explainability/transparency/controls, tailored responses
15. Decrease Trust: information gatekeeping & seeing biases
16. No change on Trust: Attributes on dashboard don’t matter for their task
17. Trust Depends on the correctness of user models
18. No change on Trust: user is unsure if user models exist
19. User model changed frequently
20. Discomfort to see and correct (some) dimensions
21. Current dimensions are limited (incomplete/ambiguous subcategories, more granularity)
22. Some existing user attributes are concerning
23. Information gatekeeping and stereotypical responses
24. Biases/mistakes in the model
25. Cold start and drift of user model => need more conversations
26. Privacy concerns: Potential misuse of user “profiles”
27. Some users expect their privacy to be violated when using these tools
28. Debiasing and Detaching User Model

K Three versions of dashboard interfaces

We provided the three versions of TalkTuner dashboard used in our user study below:

Figure 18: **UI 1:** Baseline interface that only shows the ongoing chat history accepts new inquiries from users.

Figure 19: **UI 2:** Experimental interface that shows the chatbot's internal model of users on the left at initialization. At the beginning, the dashboard predicts every user attribute as unknown as there is no information (no conversation) about users.

Figure 20: **UI 2:** Experimental interface that shows the chatbot's internal model of users on the left. This interface **does not** allow users to control the chatbot's internal user model.

Figure 21: **UI 3:** Second experimental interface that shows the chatbot's internal model of users on the left, which **does** allow users to control the chatbot's internal user model.
